

Quality First

once again, Lafourche Parish Water District No. 1 is pleased to present our annual water quality report, covering all testing performed between January 1 and December 31, 2020. As in years past, we are committed to delivering the best-quality drinking water possible. We remain vigilant in meeting the challenges of new regulations, source water protection, and water conservation, while continuing to serve the needs of all our water users. Thank you for allowing us the opportunity to serve you and your family. Please remember we are always available to assist should you ever have any questions or concerns about your drinking water.

Source Water Assessment

A Source Water Assessment Plan (SWAP) is now available at our office. This plan is an assessment of the delineated area around our listed sources through which contaminants, if present, could migrate and reach our source water. It also includes an inventory of potential sources of contamination within the delineated area and a determination of the water supply's susceptibility to contamination by the identified potential sources. According to the Source Water Assessment Plan, our water system had a susceptibility rating of high. It is important to understand that this susceptibility rating does not imply poor water quality, only the system's potential to become contaminated within the assessment area.

If you would like to review the Source Water Assessment Plan, please feel free to contact our office during regular office hours at the number provided in this report.

We are happy to report that your drinking water meets or exceeds all federal and state requirements.

Level 1 Assessment

Oliforms are bacteria that are naturally present in the environment and are used as an indicator that other waterborne pathogens may be present or allow for a potential pathway for contamination within the drinking water distribution system. When coliforms are detected, an assessment must be conducted to identify potential causes and correct those discovered.

In 2020, the District detected coliforms, which required a Level 1 assessment to be performed. There were no corrective actions required to be taken, as the assessment didn't reveal any issues contributing to the presence of the coliforms.

Where Does My Water Come From?

In 2020, our water department distributed approximately 3.6 billion gallons of clean drinking water to our customers. Our water source is surface water taken from Bayou Lafourche. The district has two water treatment plants. The South Plant, located in Lockport, has been

in operation since 1955. It is capable of producing 12 million gallons of potable drinking water per day and furnishes water primarily to the central and south Lafourche areas. The second plant is

the North Plant, located in Thibodaux. It has been in operation since 1989. Its maximum plant production is 6 million gallons per day, and it supplies water to the northern portion of the parish. Both treatment facilities purify your water through disinfection and filtration to remove or reduce harmful contaminants that may come from the source water.

Public Meetings

We want our valued customers to be informed about your water utility. You are invited to attend regular water district board meetings on the third Thursday of each month, beginning at 6:00 pm, in the district office, at 5753 Highway 308, Lockport, LA 70374.

Lead in Home Plumbing

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high-quality drinking water, but we cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at (800) 426-4791 or at www.epa.gov/safewater/lead.

Substances That Could Be in Water

To ensure that tap water is safe to drink, the U.S. EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water that must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals, in some cases, radioactive material, and substances resulting from the presence of animals or from human activity. Substances that may be present in source water include:

Microbial Contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, or wildlife;

Inorganic Contaminants, such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming;

Pesticides and Herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses;

Organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production and may also come from gas stations, urban stormwater runoff, and septic systems;

Radioactive Contaminants, which can be naturally occurring or may be the result of oil and gas production and mining activities.

For more information about contaminants and potential health effects, call the U.S. EPA's Safe Drinking Water Hotline at (800) 426-4791.

Information on the Internet

The U.S. EPA (https://goo.gl/TFAMKc) and the Centers for Disease Control and Prevention (www. cdc.gov) Web sites provide a substantial amount of information on many issues relating to water resources, water conservation and public health. Also, the Louisiana Center for Environmental Health has a Web site (https://goo.gl/c8WW2h) that provides complete and current information on water issues in Louisiana, including valuable information about our watershed.

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as those with cancer undergoing chemotherapy, those who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants may be particularly at risk from infections. These people should seek advice about drinking water

from their health care providers. The U.S. EPA/CDC (Centers for Disease Control and Prevention) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791 or http://water.epa.gov/drink/hotline.

QUESTIONS? If you have any questions concerning your water utility or about this report, please contact Jenny Robichaux by calling (985) 532-6924 or (800) 344-1580 or by writing to this address: P.O. Box 399, Lockport, LA 70374.

Water Main Flushing

Distribution mains (pipes) convey water to homes, businesses, and hydrants in your neighborhood. The water entering distribution mains is of very high quality; however, water quality can deteriorate in areas of the distribution mains over time. Water main flushing is the process of cleaning the interior of water distribution mains by sending a rapid flow of water through the mains.

Flushing maintains water quality in several ways. For example, flushing removes sediments like iron and manganese. Although iron and manganese do not pose health concerns, they can affect the taste, clarity, and color of the water. Additionally, sediments can shield microorganisms from the disinfecting power of chlorine, contributing to the growth of microorganisms within distribution mains. Flushing helps remove stale water and ensures the presence of fresh water with sufficient dissolved oxygen, disinfectant levels, and an acceptable taste and smell.

During flushing operations in your neighborhood, some short-term deterioration of water quality, though uncommon, is possible. You should avoid tap water for household uses at that time. If you do use the tap, allow your cold water to run for a few minutes at full velocity before use and avoid using hot water, to prevent sediment accumulation in your hot water tank.

Please contact us if you have any questions or if you would like more information on our water main flushing schedule.

What type of container is best for storing water?

Consumer Reports has consistently advised that glass or BPA-free plastics such as polyethylene are the safest choices. To be on the safe side, don't use any container with markings on the recycle symbol showing "7 PC" (that's code for BPA). You could also consider using stainless steel or aluminum with BPA-free liners.

How much emergency water should I keep?

Typically, 1 gallon per person per day is recommended. For a family of four, that would be 12 gallons for 3 days. Humans can survive without food for 1 month, but can only survive 1 week without water.

How long can I store drinking water?

The disinfectant in drinking water will eventually dissipate, even in a closed container. If that container housed bacteria prior to filling up with the tap water, the bacteria may continue to grow once the disinfectant has dissipated. Some experts believe that water could be stored up to six months before needing to be replaced. Refrigeration will help slow the bacterial growth.

How long does it take a water supplier to produce one glass of drinking water?

It could take up to 45 minutes to produce a single glass of drinking water.

How many community water systems are there in the U.S.?

About 53,000 public water systems across the United States process 34 billion gallons of water per day for home and commercial use. Eighty-five percent of the population is served by these systems.

Test Results

In 2020, our water was monitored for many different kinds of substances on a very strict sampling schedule. The water we deliver must meet specific health standards. The information in the data tables shows only those substances that were DETECTED between January 1 and December 31, 2020. The state requires us to monitor for certain substances less often than once per year because the concentrations of these substances do not change frequently. In these cases, the most recent sample data are included, along with the year in which the sample was taken. Remember that detecting a substance does not mean the water is unsafe to drink; our goal is to keep all detects below their respective maximum allowed levels.

We are happy to report that your drinking water meets or exceeds all federal and state requirements.

REGULATED SUBSTANCES										
					Lafourche Parish Water District No. 1–South Plant		Lafourche Parish Water District No. 1-North Plant			
SUBSTANCE (UNIT OF MEASURE)	YEAR SAMPLED	MCL [MRDL]	MCLG [MRDLG]	AMOUNT DETECTED	RANGE LOW-HIGH	AMOUNT DETECTED	RANGE LOW-HIGH	VIOLATION	TYPICAL SOURCE	
Atrazine (ppb)	2020	3	3	2.5	ND-2.5	0.2	ND-0.2	No	Runoff from herbicide used on row crops	
$\begin{array}{l} \textbf{Beta/Photon Emitters}^1 \\ (pCi/L) \end{array}$	2020	50	0	ND	NA	3.37	NA	No	Decay of natural and man-made deposits	
Chloramines ² (ppm)	2020	[4]	[4]	3.29	0.90–4.90	3.29	0.63–4.80	No	Water additive used to control microbes	
Chlorine Dioxide ³ (ppb)	2020	[800]	[800]	60	ND-60	240	ND-240	No	Water additive used to control microbes	
Chlorite ⁴ (ppm)	2020	1	0.8	0.61	0.31-0.66	0.60	0.35-0.65	No	By-product of drinking water disinfection	
Combined Radium (pCi/L)	2020	5	0	1.23	NA	0.716	NA	No	Erosion of natural deposits	
Fluoride (ppm)	2020	4	4	0.7	NA	0.5	NA	No	Erosion of natural deposits; Water additive that promotes strong teeth; Discharge from fertilizer and aluminum factories	
Haloacetic Acids [HAAs] ⁵ (ppb)	2020	60	NA	37	21–38	37	21–38	No	By-product of drinking water disinfection	
Nitrate (ppm)	2020	10	10	1.1	NA	1.1	NA	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits	
Simazine (ppb)	2020	4	4	1.2	ND-1.2	ND	NA	No	Herbicide runoff	
TTHMs [Total Trihalomethanes] ⁵ (ppb)	2020	80	NA	24	15–28	24	15–28	No	By-product of drinking water disinfection	
Total Organic Carbon ⁶ (removal ratio)	2020	ТТ	NA	1.34	0.88–2.48	1.40	0.98–2.02	No	Naturally present in the environment	
Turbidity ⁷ (NTU)	2020	TT	NA	0.12	NA	0.09	NA	No	Soil runoff	
Turbidity (Lowest monthly percent of samples meeting limit)	2020	TT = 95% of samples meet the limit	NA	100.0	NA	100.0	NA	No	Soil runoff	

Tap water samples were collected for lead and copper analyses from sample sites throughout the community.										
SUBSTANCE (UNIT OF MEASURE)	YEAR SAMPLED	AL	MCLG	AMOUNT DETECTED (90TH %ILE)	SITES ABOVE AL/TOTAL SITES	VIOLATION	TYPICAL SOURCE			
Copper (ppm)	2020	1.3	1.3	0.2	0/30	No	Corrosion of household plumbing systems; Erosion of natural deposits			
Lead (ppb)	2020	15	0	1	0/30	No	Lead services lines; Corrosion of household plumbing systems including fittings and fixtures; Erosion of natural deposits			

¹The MCL for beta particles is 4 mrem/year. The U.S. EPA considers 50 pCi/L to be the level of concern for beta particles.

Definitions

90th %ile: The levels reported for lead and copper represent the 90th percentile of the total number of sites tested. The 90th percentile is equal to or greater than 90% of our lead and copper detections.

AL (Action Level): The concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system must follow.

Level 1 Assessment: A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG (Maximum Contaminant Level Goal):

The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MRDL (Maximum Residual Disinfectant Level):

The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level

Goal): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NA: Not applicable

ND (**Not detected**): Indicates that the substance was not found by laboratory analysis.

NTU (Nephelometric Turbidity Units):

Measurement of the clarity, or turbidity, of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

pCi/L (**picocuries per liter**): A measure of radioactivity.

ppb (parts per billion): One part substance per billion parts water (or micrograms per liter).

ppm (parts per million): One part substance per million parts water (or milligrams per liter).

removal ratio: A ratio between the percentage of a substance actually removed to the percentage of the substance required to be removed.

TT (**Treatment Technique**): A required process intended to reduce the level of a contaminant in drinking water.

²The amount detected value is the highest annual running average.

³The amount detected value is the highest level obtained throughout the year.

⁴The amount detected value is the highest monthly average.

⁵The amount detected value is the highest locational running annual average.

⁶The amount detected value is the lowest running annual average (LRAA) throughout the year. A water system is in compliance with the treatment technique (TT) if this value is equal to or greater than 1.00.

⁷Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of the filtration system. A water system is in compliance with the TT when the maximum level found is less than 1 NTU and less than or equal to 0.3 NTU 95% of the time.
